Here $(g^{\mu\nu}\delta R_{\mu\nu} + 3H^2 h)$ is the fundamental scalar gauge invariant, which includes vector and tensor contributions. Unlike the flat space case shown below, we cannot reduce Δ into combinations of the pure scalars F and χ that are separate from E_{α} and $E_{\mu\nu}$.

A.2 $R^{(0)}_{\mu\nu} = 0$ (Flat)

$$x'^{\mu} = x^{\mu} - \epsilon^{\mu}(x) \tag{A.8}$$

$$h'_{\mu\nu} = h_{\mu\nu} + \nabla_{\mu}\epsilon_{\nu} + \nabla_{\nu}\epsilon_{\mu} \tag{A.9}$$

$$g^{\mu\nu}\delta R_{\mu\nu} = -6\nabla_{\alpha}\nabla^{\alpha}\chi \tag{A.12}$$

$$\begin{aligned}\delta G_{\mu\nu} &= \delta R_{\mu\nu} - \frac{1}{2} g_{\mu\nu}(g^{\alpha\beta}\delta R_{\alpha\beta}) \\ &= \nabla_\alpha \nabla^\alpha E_{\mu\nu} + 2g_{\mu\nu}\nabla_\alpha\nabla^\alpha\chi - 2\nabla_\nu\nabla_\mu\chi \end{aligned} \tag{A.13}$$

For a χ that vanishes asymptotically, we can define a gauge invariant χ as

$$\chi = -6\int D g^{\mu\nu}\delta R_{\mu\nu}. \tag{A.14}$$

Since δG is gauge invariant, all SVT scalars arising within δG can be entirely expressed in terms of derivatives onto a single χ.
